THIS! IS CANADA
VOILA! LE CANADA

This graph shows the average temperatures in the Annapolis valley during three different time periods. I chose this data because global warming is a serious issue that progressively is getting worse over time and has a huge impact on our environment, economy, daily life, etc. I think this data is important because every living (and some non-living) things are impacted by the temperatures. For example, if the temperatures are too high, animals will migrate north seeking colder temperatures. I think this data shows that temperatures are rising fairly quickly and should be a call to action to find a solution. Some solutions or progressions could include building a park in your community, reducing the amount of pavement in your area, switching to more renewable energy sources, etc. Even a single individual can do things to help reduce temperatures such as planting a garden, reducing your consumption, reusing plastic and other materials, and buying second-hand, etc. Small changes on a daily basis over a long period of time can have a huge impact.
