

Impact on Human Activity over time in New Brunswick- Climate Change Forecast

What is Climate Change? The term 'climate change' refers to "the warming of the earth's atmosphere and oceans, in addition to an increase in the natural variability of the climate". Climate change trends indicate that in our community's future, we are likely to experience warmer temperatures and increasing amounts of precipitation. The Atlantic Climate Adaptations Solutions Association has formed forecasts of future climate scenarios for the Province of New Brunswick using the output from 24 climate models developed by national weather services and research organizations. There is no doubt that our climate is changing. It is important to understand the implications of climate change and to act.
